As part of your injection routine, remember to:

1 Use a new needle.

Pen needles are designed for single use. Using the same needle for multiple injections is associated with and may increase injection pain^{1,4*}

2 Rotate injection sites.

Talk to your doctor about an injection site rotation plan that is right for you. The abdomen, thighs, arms and buttocks are generally recommended injection areas. It's important that you rotate your injections within each area and between areas on a regular basis.¹

Choose an area.

Divide that area into four sections.

Select an injection site in a section to start injecting. Use one section per week.

Inject within sites at least one finger width apart from your last injection.

BD Nano™ 2nd Gen Pen Needles can help you inject with more comfort and confidence.¹

Accept no substitute

Update your injection experience with **BD Nano™ 2nd Gen Pen Needles.**²

Needles shown at actual size.

BD Nano™ 2nd Gen Pen Needles – a comfortable contoured needle base that helps you hold the pen against your skin without wobbling, also providing a more reliable injection.^{2,3†}

Update your injection experience to a contoured needle base.

Why is it important to inject with **shorter** needles?

Insulin is meant to be injected into the fat layer **just below the skin** for consistent absorption.⁴

For illustration purposes

- 1 Shorter needle lengths (6 mm or less) decrease the risk of injecting into the muscle.^{4§}
- 2 Injecting insulin into muscle is associated with unpredictable absorption and variable blood sugars.⁴

^{*}Compared to other pen needles studied. Results from clinical study assessing patient preferences and feedback. [†]Results from swine studies showing drug under the skin after injection. [‡]Across recommended injection sites: abdomen, thigh, arm, buttock, pooled across gender and BMI. [§]Compared to longer needles.
