

Enhancing Hospital Associated Infection (HAI's) prevention efforts through co-creation of a patient risk stratification tool

“To enhance our HAI prevention efforts, we have partnered with BD to co-create a tool that identifies the most at risk patients, while supporting healthcare decision making.

The program through BD focuses on targeted intervention including education and training when and where it is most needed.

HAI dashboards are created, and we have the ability to track infection quality markers on a routine cadence.

Together, we are working in innovative ways.”
